- ▣ User Community
- ▣ MERMAid 2.0
- ▣ New Data Entry Interfaces
- ▣ Architecture
- ▣ Services

Two Perspectives within NESDIS Data Architecture

External Metadata Services

"... Ensure the Quality of Metadata"

Long-Term Stewardship

"Long-term stewardship of past, present & future environmental observations"

Background

- Remote web access
- Accounts can be distributed to organizations external to NOAA
- No licensing fees
- Ability to support multiple profiles
- Full feature validation
- Hierarchy to support multiple record collections from variety of customers
- Publish metadata to several external destinations

User Community

- ▣ Over 500 user accounts
 - NOAA - 5 Line Offices and 20+ activities
 - USGS
 - Bureau of Land Management
 - US Army Corps of Engineers
 - US Navy
 - NASA
 - Gulf of Mexico Alliance
 - 30 universities, schools and laboratories
 - States Agencies: AK, AL, AZ, FL, LA, MA, MS, TX
 - Non-Governmental Organizations
 - Private Industry and Individuals
 - International (mainly from universities and labs)
 - and more ...

New Look and Feel

The screenshot displays the Species Cataloger application interface. The main form includes fields for taxonomic classification: Kingdom, Subkingdom, Superdivision, Division, Subdivision, Phylum, Subphylum, Class, Subclass, Superorder, and Order. There are also fields for higher-level classification: Superorder, Infraorder, Family, and Subgenus. A 'Publication Date' field is present, with a validation error message stating: 'The date defined is not in a valid format. It must be be in the form YYYY or YYYYMM or YYYYMMDD'. A calendar widget is open, showing February 2009. A 'Description' pop-up is visible, containing the text: 'Description - Summary description of the data set' and 'Type: Compound'. At the bottom, an 'Originators' list is shown, containing the entry: 'Your name here, NOAA/NESDIS/NODC/NCDDC'. The interface includes a 'CMS' button and an 'Import' button in the top right corner.

-<abstract>

A Tucker-trawl survey along the upper bay axis was conducted to collect ichthyoplankton and zooplankton samples. At each station, a 1-m2 mouth opening Tucker trawl with 280-µm mesh net was fished for 2-minutes in the bottom, mid-depth, and surface layers to provide three depth-discrete samples. Seven stations were sampled on 9-10 October for a total of 21 samples. Additional Tucker-trawl samples were collected during the first 26 hour time series (8-9 October, see below). Ctenophores (Mnemiopsis leidyi) were collected throughout the study area.

- ▣ Profile support: FGDC Standard, Biological, Shoreline, Remote Sensing, ISO 19115, NAP Profile, EML, Sensor ML
- ▣ Output support: XML, HTML, Text, Tabbed, FAQ, MARC
- ▣ Ability to convert between all supported profiles
- ▣ Ability to publish to multiple data sources (GOS, NBII, REDM, NOS Data Explorer, etc.)
- ▣ Versioning of records
- ▣ WebDav support
- ▣ Search and replace
- ▣ Reporting (customized report capability)
- ▣ Distributed system
- ▣ Standalone version
- ▣ Centrally managed elements (contacts, distribution information, etc.)
- ▣ Enhanced user interface controls
- Ability to preserve formatting in data entry fields
- Direct integration with externally managed vocabularies
- External APIs for communication with external applications such as OER's CIMS, REDM, etc.
- Taxonomic hierarchy service
- Distributed instances
- Unique document identifier
- Customized templates
- User preferences to manage customizable settings
- Account management and reporting service
- Record review management screens
- Viewable workflow history
- Link management service
- Graphical view of geospatial information
